

Eol Template Outline (+/- 1,500-2,500 words per Eol) – Due date CoB September 19

Section 0 – Title and contact Information

- Title of the proposed solution track: **Scaling Conservation Agriculture to One Million Hectares in Morocco: Building Climate Resilience and Employment for Rural Youth**
- Title of the AoW2 Flagship that the solution track aligns with: **Flagship 2.1: Scaling Seed and Soil Fertility Management Systems for Resilient, Diverse, and Nutrition-Smart Farming**
- Lead Scientist(s) / Contact Person(s) / Center(s): Rachid Moussadek, Mina Devkota, Vinay Nangia, Bassi Filippo, Michael Baum, Rhiannon Crichton (ICARDA)
- Emails of the Lead Scientist(s) / Contact Person(s) / Center(s): R.Moussadek@cgiar.org, m.devkota@cgiar.org, v.nangia@cgiar.org, f.bassi@cgiar.org, M.Baum@cgiar.org, R.Crichton@cgiar.org
- Key CGIAR Center Partners (in the case of multi-Center Eols): ICARDA
- Technical link to other Science Programs: Sustainable Farming, Climate Action, Breeding for Tomorrow

Section 1 – Innovation Package, Value Proposition & Alignment

Purpose: *To establish what the innovation is, who the customers and end-users are, why it matters, and how it connects to S4I's Flagships and Grand Challenges.*

The problem to be solved: *Describe the challenge you are seeking to overcome through the proposed Scaling Solution track. What country / countries will the Solution Track operate in? Be sure to clarify who you are seeking to benefit with this work, with attention paid to gender and social inclusion. (~150 words)*

The Government of Morocco, through its “[Generation Green 2020–2030](#)” strategy, aims to scale conservation agriculture (CA) to 1 million hectares by 2030. Progress has been steady, with CA adoption increasing from 10,500 hectares in 2015/16 to 200,000 hectares in 2024/25, supported by national and private-sector initiatives. Despite this growth, reaching the 2030 target will require all partners to accelerate adoption. Key challenges include limited farmer awareness and knowledge on CA practices, restricted access to scale-appropriate no-till seeders and adapted crop varieties, competition for crop residues between soil cover and livestock feed, and gaps in supportive policies and institutional incentives. Farmers, extension agents, and policymakers may also face mindset barriers regarding the benefits of CA. Women and rural youth encounter additional constraints in accessing technologies, training, and employment opportunities within CA systems. This SST will address these gaps through targeted awareness campaigns and participatory training, plot-specific agro-advisory on CA practices including crop rotation with legumes, integrated weed, pest, and nutrient management, improved access to scale-appropriate no-till seeders through youth-led service provision, and guidance on crop residue management and livestock integration. By engaging women, youth, and marginalized groups, the program will ensure equitable access to knowledge and technologies, build climate resilience, and generate new rural employment opportunities.

Your scaling ambition: Describe the ambition of your proposed Scaling Solution track. Which of the KPIs do you believe you will contribute most towards, and at what level of quantitative and qualitative impact? (~150 words)

Working with the Moroccan government and partners to scale conservation agriculture (CA) to 1 million hectares will directly engage over 300,000 farming households, benefiting more than 4 million rural people, with particular attention to women, youth, and marginalized groups. By promoting CA practices—including minimum tillage, crop rotation with legumes, residue management, integrated nutrient, pest, and weed management, and improved varieties—this SST will enhance productivity by 10–15%, improve soil fertility, stabilize yields, and strengthen climate resilience.

The track will deliver over 30,000 tons of certified CA-adapted seed, engage 1,000 seed multiplier farmers, and support 2,000 seed shops, generating USD 14+ million in annual gross value. Mechanization will be scaled through youth-led service provision, with 1,000 locally manufactured no-till seeders (ATMAR) available for hire, ensuring timely sowing. These interventions will create +5,000 rural jobs, strengthening over 370,000 existing jobs, and favour greater food diversity via the promotion of legumes in rotation, directly contributing to S4I KPIs: 20M+ (4M) people access agrifood solutions, helps create 0.25M+ jobs (0.05M), enables 0.48M+ (0.1M) consumers to access diverse foods, and 10M (1M) hectare adopt climate-smart and biodiversity-friendly practices.

Innovation & Value Proposition – Describe:

- *the innovation or bundle or package (maturity, novelty, suitability for scaling)*
- *and the benefits it delivers to institutional partners/customers and end-users (e.g., productivity, resilience, nutrition, risk reduction, institutional capacity).*
- *Can include linkages to other science programs that will collaborate and work on the innovation/bundle/package (~150 words)*

Conservation Agriculture (CA) is a mature, climate-resilient innovation well-suited for scaling in the drylands of Morocco. The CA “package” integrates minimum soil disturbance, permanent soil cover, crop rotation (including legumes and forage), residue management, low-impact pest and weed control, and adapted varieties, complemented by mechanization (no-till seeders), digital advisory tools including extension services and carbon market opportunities, and youth-led service provision. Adoption of the full CA package can increase yields by 10–20% in normal seasons and up to 100% in severe drought years, stabilizing farm incomes, reducing climate risk, enhancing soil fertility, and supporting carbon sequestration for climate mitigation.

For institutional partners, CA provides actionable pathways for national food security, sustainable intensification, and climate-smart agriculture targets. End-users benefit through improved agronomic performance, resilience to climatic shocks, diversified cropping systems, and access to improved seeds and advisory services. Regional steering committees are already in place to guide implementation but strengthening their capacity to coordinate across stakeholders and facilitate adoption pathways will be critical to accelerate scaling.

This SST links with the Sustainable Framing, Breeding for Tomorrow, Climate Action programs and Gender Equality and Inclusion Accelerator.

Customers & Alignment – *Identify the main institutional customers (ministries, donor programs, agribusinesses, lenders) and end-users (farmers, SMEs, cooperatives). Show how the track aligns to an AoW2 Flagship and Grand Challenge. (~100 words)*

The institutional partners mirror those in Morocco's CA steering committees: Ministry of Agriculture regional offices (MAPMDREF), INRA, extension entities (ONCA, Tourba, Al Moutmir), local policymakers, seed companies (SONACOS, AMMS), machinery providers, Crédit Agricole, and rural development funds. End-users include smallholder farmers, women farmers, youth-led service providers, AMAC, cooperatives including womens-cooperatives, and SMEs engaged in mechanization and input supply. This partnership model directly reflects AoW2's Flagship 2.1 and Grand Challenge 2: Deliver Inputs and Services at Scale through Inclusive Market Systems. By linking farmers and service providers to climate-resilient seeds, machinery, fertilizer, finance, and advisory services, the Track ensures inclusive access, accelerates CA adoption, strengthens local markets, and builds institutional capacity.

Evidence of Impact – *Provide citations and evidence of both effectiveness (impact) and scalability in practice (uptake beyond pilots, adoption drivers). (~150 words)*

Effectiveness: Conservation Agriculture (CA) in Morocco has [demonstrated](#) significant agronomic, economic, and environmental benefits. Farmer-managed trials [report](#) yield increases of approximately 16% and net profit increases of about 21% compared to conventional tillage in rainfed systems, with best-performing farms achieving over 30% yield improvement. CA [also](#) enhances soil fertility, moisture retention, reduces erosion, and supports carbon sequestration, contributing to climate resilience and mitigation.

Scalability: The adoption of CA has been supported by strong policy frameworks. The Morocco Green Generation Strategy (GGS) aims to increase the economic inclusion of youth in rural areas and enhance the marketing efficiency and environmental sustainability of agri-food value chains. The program's development objective indicators include the adoption of climate-smart agriculture practices, with targets for producers benefiting from agricultural advisory extension services for efficient water use.

Section 2 – Scaling Pathway, Sustainability, Partnerships & Risks

Purpose: *To assess whether there is a credible pathway for the innovation to scale through public, private, or PPP delivery models — supported by sustainability plans, partner demand and commitments, financial leverage, and risk mitigation.*

Scaling Pathway & Sustainability – *Describe how the innovation bundle and/or package will scale (public, private, PPP). Explain how the solution will remain viable at scale (revenues, public financing, PPP, IFI/donor support), with milestones or cost-recovery targets. (~250 words)*

The SST will work with regional CA steering committees established by the Government of Morocco, bringing together public agencies, research institutions, cooperatives, and private

sector actors to coordinate scaling efforts that stimulate farmers' demand and enhance their access to knowledge, inputs, and mechanization.

Farmer demand and capacity will be strengthened through on-farm demonstrations, field days at innovation platforms, national agricultural fairs (e.g., Meknes SIAM), targeted awareness campaigns, and ongoing engagement with steering committees. Input supply will be supported via scientific backstopping that will guide deployment of suitable planters, and support early-generation seed production, certified seed multiplication with private seed companies, and streamlined seed certification via ONSSA.

Public-Private-Philanthropic Partnerships (PPPPs) ensure sustained financial support for subsidies, last-mile service provision, and emerging carbon market opportunities linked to soil carbon sequestration under CA. Once initial adoption constraints—planter access, seed availability, and farmer knowledge—are overcome, CA adoption becomes self-sustaining: yield gains, cost reductions, and improved resilience generate economic incentives for farmers, complemented by targeted public financing and PPPP support.

Key milestones for adoption, aligned with government targets under the Generation Green strategy, are:

- **MS1 (2026):** 250,000 ha of CA declared; ~75,000 households, 30% women and youth engaged
- **MS2 (2027):** 350,000 ha of CA declared; ~105,000 households, expanded women/youth participation
- **MS3 (2028):** 500,000 ha of CA declared; ~150,000 households, 40% women and youth involved

These milestones capture simultaneous progress in farmer adoption, seed production capacity, planter availability, and effective coordination via steering committees, ensuring long-term viability and scalability.

Partnerships & Leverage – *Identify internal CGIAR champions and external partners that have a stake in championing the innovation bundle or package, provide evidence of demand (surveys, requests for collaboration, alignment with policies or strategies) and commitment (MOUs, LOIs, budget allocations from partners, or other evidence of demand), and specify major non-CGIAR programs or investments this track can leverage (budgets, partners, policies, programs, etc).* (~300 words)

The Government of Morocco, advised by ICARDA and INRA, has formally established regional CA steering committees that bring together all key stakeholders: Ministry of Agriculture regional offices (DPA), national research institutions (INRA), public and private extension entities (Tourba, Al Moutmir, ONCA), seed and fertilizer businesses (SONACOS, AMMS, OCP), agricultural finance institutions (Crédit Agricole), and rural development funds. End-users—including farmer representatives, AMAC, cooperatives, and SMEs providing machinery, planters, and inputs—are active members, ensuring participatory planning and adoption. MOUs have been signed across these institutions, and in several cases with ICARDA, demonstrating strong institutional commitment.

The public commitment to scaling CA to 1 million hectares by 2030 is enshrined in Morocco's Generation Green strategy, with dedicated government budgets supporting subsidies for certified seed and cost-sharing for small-scale zero-till planters. Approximately USD 500,000 annually is allocated to the INRA-ICARDA research partnership to develop and validate innovations suitable for CA, with additional private and philanthropic contributions supporting farmer training, demonstration plots, and access to mechanization.

Several complementary programs provide leverage for this SST, including:

Project	Duration	Donor	Partners	Annual budget (US\$)
MCGP	2025	Moroccan Government	INRA	500,000
MCGP	2025-2030	Moroccan Government	INRA	2,500,000 (pipeline)
Wheat Accelerator	2025-2028	IDRC, Canada	INRA	250,000
Carbon sequestration		World Bank	INRA	150,000
FAO- water scarcity	2025-2027	FAO	INRA	150,000
African Union Soil Observatory	2025-2030	European Union	INRA	150,000

These initiatives demonstrate clear demand for CA, alignment with national policies, and significant leverage potential, providing both financial resources and technical platforms to scale adoption, strengthen capacity, and ensure long-term sustainability.

Risks & Bottlenecks – Identify specific risks (financial, political, operational, social, or others) and bottlenecks (policy, institutions, finance, technology) in the specific context and place that could hinder scaling. Describe potential mitigation strategies to address these risks and bottlenecks. (~250 words)

Morocco is experiencing its seventh consecutive year of drought, which both increases the urgency for adopting conservation agriculture (CA) and constrains farmers' willingness to invest scarce resources in new technologies. Although synergetic investments in technology development, policy support, and end-user engagement create strong conditions for scaling, adoption rates have slowed—from a 10-fold increase (10,000 to 100,000 ha) in the initial four years to only a 2-fold increase over the past two years (100,000 to 200,000 ha)—highlighting operational and behavioural bottlenecks. Scaling an additional 750,000 hectares over the next five years will require innovative strategies through less familiar pathways, which may introduce new technological, institutional, and social risks.

Key bottlenecks include farmers' access to no-till seeders, adapted seeds, and advisory services; the complexity of CA practices (crop rotations, residue management); competition for crop residues with livestock; and farmers' risk aversion to new methods. Short-term yield variability during the transition period may also pose an adoption risk.

To mitigate these challenges, the SST will sustain momentum through continuous scientific backstopping, targeted outreach, risk-sharing mechanisms, and development of alternative adoption pathways. Public-private-philanthropic partnerships will ensure input supply, last-mile

support, and youth-led service provision. Engagement with regional steering committees and policymakers will strengthen institutional continuity, enabling long-term, large-scale CA adoption.

Section 3 – Responsible Scaling Trajectory & Achievable Scaling Target

Purpose: *To define what can realistically be achieved with S4I support in the next 2–3 years — including achievable reach, milestones, resources, activities, and safeguards for responsible scaling.*

Readiness & Responsible Scaling – *Provide evidence of scaling readiness (IPSR or similar evidence). Describe actions for ensuring that scaling will be inclusive (extending to women, youth, marginalized groups) and environmentally sustainable. (~150 words)*

Conservation Agriculture (CA) in Morocco has already been adopted on over 200,000 ha, representing more than a 10-fold increase in six years, demonstrating strong readiness for scaling. IPSR and farmer-managed trials confirm agronomic and economic effectiveness, while national CA steering committees, AMAC (a youth-focused farmers' association), and regional extension services provide institutional pathways to support uptake. Youth are already actively engaged in service provision, mechanization support, and digital advisory delivery, while women's participation is growing and targeted outreach, tailored training, and inclusive demonstration plots will ensure broader engagement of women and marginalized groups. CA is environmentally sustainable: it improves soil fertility, enhances water-use efficiency, reduces erosion, increases carbon sequestration, and contributes to climate mitigation.

Achievable target, Resources & Activities – *Define what can realistically be achieved in 2–3 years starting 2026 forward with S4I support and current/planned partnerships. Outline the key resources (staff, institutional, financial, technical) and activities (e.g., training, policy engagement, distribution) required. (~250 words)*

By 2028, the SST aims to more than double the current area under conservation agriculture (CA) in Morocco, reaching 500,000 ha, while ensuring delivery of locally adapted cereal, legume, and forage seeds, and expanded access to no-till seeders. This target will directly benefit smallholder farmers, particularly youth and women, by increasing productivity, resilience, and income opportunities.

Key activities include:

1. Demand creation and capacity building: farmers' field days, on-farm demonstrations, peer-to-peer exchanges, and participatory adoption campaigns targeting new areas.
2. Awareness and outreach: dedicated campaigns and displays at national agricultural fairs to showcase CA benefits.
3. Service provision and mechanization: deployment of low-cost, locally manufactured no-till seeders and support for youth-led service providers.
4. Strengthening plot-specific fertilizer advisory combined with CA-based crop management practices in collaboration with national extension
5. Seed system strengthening: production of early-generation seeds over 30 ha and support for seed certification improvements in collaboration with ONSSA and private seed companies.

6. Policy and scientific support: workshops with steering committee members, assessments of planter suitability across soils, and technical guidance through ICARDA-SF collaboration.

Resources required: technical backstopping from ICARDA and INRA; engagement in CA steering committees; extension staff; private-sector seed and machinery partners; and financial support through government subsidies, CGIAR S4I funding, and public-private-philanthropic partnerships.

Estimated annual budget: USD 500,000 per year (2026–2028), supporting training, awareness, mechanization, precision fertilizer management, seed production, and policy engagement to ensure sustainable scaling and long-term adoption of CA practices.

Timeline, Milestones & Monitoring – Provide an estimate of annual milestones for 2026–2028 (users reached, partnerships formed, policies adopted). Explain how progress will be monitored, lessons captured, and adaptations made. (~200 words)

Progress of the Scaling Solution Track will be tracked annually from 2026–2028 using a combination of government-declared adoption data via the **Zar3Direct** digital monitoring tool, reports from steering committees, and project-level KPIs. Official government adoption targets provide primary milestones:

- **MS1 (2026):** ≥ 250,000 ha under CA
- **MS2 (2027):** ≥ 350,000 ha under CA
- **MS3 (2028):** ≥ 500,000 ha under CA

Additional milestones include the engagement of farmers (with attention to women and youth), formation and activation of partnerships, and policy improvements.

Monitoring, Lessons Learned & Adaptation: Annual reports from ICARDA, INRA, and steering committees will synthesize lessons learned, evaluate progress, and recommend adjustments. The S4I team working on this SST will conduct annual Pause & Reflects to consider how these findings should be applied. Digital tools allow remote monitoring of adoption, while farmer feedback and peer-to-peer exchanges will guide iterative refinement of outreach, service provision, and policy interventions. This integrated approach ensures that scaling is evidence-driven, inclusive, and responsive to local conditions.

Optional Annexes

PRMS results including IPSR Innovation Profiles

[innovation development output] [Fostering the scaling of mechanised conservation agriculture by small farmers in Morocco \(MOROCCO-Conversation Agriculture Use Case\)](#)

Conservation Agriculture (CA) optimizes agro-ecosystem management to enhance productivity, profitability, and food security for smallholder farmers, while conserving and improving the environment. This innovation comprises two main components: MVP 1: Integrates mechanized conservation agriculture with precise agronomy tailored to Morocco's diverse soil and climate conditions, focusing on crop diversification and effective weed control, to be implemented by

smallholder farmers. MVP 3: A collaborative effort to scale up mechanised CA with the involvement of various sector stakeholders, specifically designed for smallholder farmers. This component acts as a strategic roadmap for national governments, donors, financiers, extension services, and NGOs to spread CA technologies among smallholder farming communities efficiently.

[Innovation development output] [No-till seeder adapted in public-private partnership to Moroccan crops and soil types for Moroccan smallholder farmers to practice zero tillage Conservation Agriculture](#)

The no-till seeder machinery has been developed to support Morocco's national plan of having one million hectares of farming land under Conservation Agriculture practices by 2030 (Generation Green 2020-2030). Developed by an ICARDA, INRA, and local manufacturer team, using technology imported from dryland farming machinery in Australia, the no-till (zero tillage) seeder enables smallholder farmers in Morocco to sow seeds directly into the soil (direct seeding) without causing any mechanical modification of the soil structure. No-till practices are expected to enhance the resilience of dryland smallholder farmers by reducing soil erosion and increasing the retention of carbon dioxide, water, and organic matter in the soil.

[Innovation development output: [Conservation agriculture improves agronomic, economic, and soil fertility indicators for a clay soil in a rainfed Mediterranean climate in Morocco | ICARDA](#)

The benefits of adoption of conservation on agronomic, economic and soil fertility indicators has been highlighted.

[Performance of elite genotypes of barley, chickpea, lentil, and wheat under conservation agriculture in Mediterranean rainfed conditions | ICARDA](#)

[Innovation development output] [Supplemental irrigation of wheat to mitigate productivity loss when the soil moisture content drops to 60% during periods of drought in rainfed cropping systems in Morocco and across MENA](#)

Supplemental irrigation is the practice of providing additional water to crops to support their survival, especially during periods of drought. Wheat cropping systems in Morocco and across much of the Middle East and North Africa (MENA) are predominantly rainfed and vulnerable to poor crop yields or total failure with increasing rainfall variability and high-temperature extremes. Crop yield reduction or total loss can cause economic, social, agricultural, and food security challenges. In situations where supplemental irrigation is possible, irrigation scheduling is done through the in-situ measurement of soil moisture content at a depth of 90 cm. Irrigation water is applied through drippers when the available soil moisture content in the soil profile drops to 60 %. In drought years, the precise application of 28-166 mm supplemental irrigation (depending on drought severity) has been found to increase wheat productivity by 2-3 t ha⁻¹ when compared to rainfed conditions.

[innovation development output] [Lentil elite lines and new varieties targeted to Morocco and similar agroecologies that are early-maturing, drought-tolerant, semi-erect habit, and have high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for lentil in Morocco.

[innovation development output] [Faba bean elite lines and new varieties targeted to Morocco and similar agroecologies that are drought-tolerant, resistant to major biotic stresses, machine-harvestable and have high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for faba bean in Morocco.

[innovation development output] [Durum wheat elite lines and new varieties targeted to Morocco and similar agroecologies that are drought-tolerant, resistant to Hessian Fly, and have high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for durum wheat in Morocco and similar agroecologies that are drought-tolerant, resistant to Hessian Fly, and have high-yield potential.

[innovation development output] [Bread wheat elite lines and new varieties targeted to Morocco and similar agroecologies that are drought-tolerant, resistant to major biotic stresses, have good protein content, and high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for bread wheat in Morocco and similar agroecologies that are drought-tolerant, resistant to major biotic stresses, have good protein content, and high-yield potential.

[innovation development output] [Barley elite lines and new varieties targeted to Morocco and similar agroecologies that are early-maturing, drought-tolerant and have high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for barley in Morocco and similar agroecologies that are early-maturing, drought-tolerant and have high-yield potential.

[innovation development output] [Chickpea elite lines and new varieties targeted to Morocco and similar agroecologies that are resistant to Ascochyta blight, large-seeded, machine-harvestable, and have high-yield potential](#)

Genetic innovations at the levels of target product profiles for breeding, elite lines in development, and newly released varieties that have been prioritised by national stakeholders for fast-tracked development and release in their country and similar agroecologies. This record is for chickpea in Morocco and similar agroecologies that are resistant to *Ascochyta* blight, large-seeded, machine-harvestable, and have high-yield potential.

[innovation development output] [Zar3Direct – A Digital Platform to Track Conservation Agriculture Adoption, Connect Stakeholders, and Provide a Comprehensive Dashboard for Smallholder Farmers, Agronomic Advisors, and Service Providers in Morocco](#)

Conservation Agriculture (CA) optimizes agro-ecosystem management to enhance productivity, profitability, and food security for smallholder farmers, while conserving and improving the environment. MVP 2: Zar3Direct, a digital platform currently under development, aims to track the adoption rates of CA among smallholder farmers and provide a comprehensive dashboard. This platform will connect agronomic advisors, CA machinery and service providers, and farmers practising CA, facilitating a unified approach to CA adoption for smallholders.

[other output] [Third Africa Congress on Conservation Agriculture \(3ACCA\)](#)

The Third Africa Congress on Conservation Agriculture (3ACCA), was held in Rabat, Morocco, 5 – 8 June 2023. The Africa Congress is jointly organized by African Conservation Tillage Network (ACT), Kingdom of Morocco, the African Union Commission, the NEPAD Agency, the Food and Agricultural Organization (FAO) of the UN, INRA Morocco and ICARDA, in collaboration with the Hassan II Agronomic and Veterinary Institute (IAVH2), Moroccan Association of Conservation Agriculture (AMAC), the National School of Agriculture of Meknes (ENAM) and other classified Sponsors. It's objective is to bring together and enable experts, practitioners, and policymakers to share best practices and enable the adoption of Conservation Agriculture (CA) and Sustainable Agricultural Mechanization (SAM) as a basis for building resilience to climate change amid the increasing food and energy prices and disruptions in distribution systems.

[innovation use outcome] [Integration of Conservation Agriculture: Excellence in Agronomy Morocco's Use Case Enhancing Adoption, Research, and Digital Monitoring in Agricultural Ecosystems](#)

The Excellence in Agronomy (EiA) Morocco Use Case is propelling the advancement of Conservation Agriculture (CA) through focused initiatives. This involves a thorough update on CA research, focusing on crop diversification and weed control, tailored to Morocco's diverse soil and climate conditions. Emphasis is placed on data collection and analysis to uncover key factors influencing CA adoption, including an in-depth look at farmers' practices and barriers to CA adoption by 2030. A significant development is the pilot digital platform for CA monitoring, designed to track vital elements like soil health, crop rotation, and yield. This platform integrates CA suitability maps, identifying priority areas for effective scaling interventions. These concerted efforts aim to boost CA adoption, promoting sustainable agricultural productivity and environmental conservation in Morocco.

[policy change outcome] [Conservation Agriculture: CGIAR helps Building Capacity to Implement Morocco's Green Generation Initiative for 1 Million Hectares of Direct Seeding in Rainfed Cereal Systems](#)

Morocco's efforts to mainstream conservation agriculture (CA) into national strategies, such as the Green Generation Strategy (2020-2030) and Africa's Rabat Declaration by 3ACCA, have been driven by extensive capacity-building initiatives led by ICARDA, INRA, and key partners. Training workshops, field days, and high-level policy dialogues equipped over 2,000 farmers, service providers, and policymakers with the knowledge to adopt sustainable practices like direct seeding, crop rotation, and residue conservation. A special focus on digital tools, gender-sensitive approaches, and youth engagement significantly enhanced the program's inclusivity and impact. These activities resulted in a roadmap for scaling CA across one million hectares, supported by a carbon credit initiative targeting 50,000 hectares. Collaborative events, such as the International Agricultural Fair in Meknes, fostered partnerships among public institutions, private entities, and NGOs. This integrated approach strengthens agricultural productivity, soil health, and resilience against climate change, while contributing to food security and sustainability in Morocco and beyond.

[policy change outcome] [Excellence in Agronomy supports partners in Morocco to incorporate direct seeding/conservation agriculture recommendations in national strategy and farmer networks](#)

Agronomy-at-scale solutions (on conservation agriculture) are being integrated into the support mechanisms, country strategies (Green Generation strategy) and also support from the private sector in complementing financial support by the government to access direct seeders by farmers.

[other outcome] [Institut National Recherche Agronomique \(INRA\) Morocco will submit for registration/release 11 elite lines of CGIAR-INRA bred barley \(1\), bread wheat \(3\), durum wheat \(4\), faba bean \(1\), and chickpea \(2\)](#)

The Institut National de la Recherche Agronomique (INRA) Morocco is advancing the registration and release of 11 elite lines issued from the collaboration between CGIAR and INRA in Morocco, including barley (1), bread wheat (3), durum wheat (4), faba bean (1), and chickpea (2). The seed of these varieties are now being multiplied and their release will represent a significant step toward enhancing food security and resilience across the region.
